

Single String Completion: Single Zone

This type of completion equipment is most commonly used on single zone wells or multi-zone wells with no commingling restrictions. The simplistic design allows coiled tubing installations to be performed without the aid of a Select Energy service technician for greater cost saving.

The integral installation thread configuration allows installation to API or ANSI casing valves without the need for crossovers or swages while providing annular access ports for both flow and pressure monitoring. The resulting reduction of thread connections means reduced leak path points. The short stack height of this design is ideal in areas where interference with agricultural irrigation systems becomes an issue.

The versatile design allows for use in a wide range of tubing sizes. The ability to easily redress the threaded wellhead in the field offers the ultimate in cost, reliability, and function.

COMPLETION EQUIPMENT			
ITEM	QTY.	DESCRIPTION	Page #
1	1	2590S Threaded Wellhead	21
2	1	Coiled Tubing	130
3	1	Landing Nipple with Shear Out Plug	58
